Association Rule Mining

Given a set of (several millions of) transactions, find rules that will predict the occurrence of an item based on the occurrences of other items in the transaction

Market-Basket transactions

<i>TID</i>	<i>Items</i>
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

Example of Association Rules

$\{\text{Diaper}\} \rightarrow \{\text{Beer}\},$

$\{\text{Bread}\} \rightarrow \{\text{Milk}\},$

$\{\text{Bread, Milk}\} \rightarrow \{\text{Diaper}\}$

Implication means co-occurrence, not causality!

Definition: Frequent Itemset

Itemset

- A collection of one or more items
Example: {Milk, Bread, Diaper}
- k-itemset
An itemset that contains k items

Support count (σ)

- Frequency of occurrence of an itemset
- E.g. $\sigma(\{\text{Bread, Milk, Diaper}\}) = 2$

Support

- Fraction of transactions that contain an itemset
- E.g. $s(\{\text{Milk, Bread, Diaper}\}) = 2/5$

Frequent Itemset

- An itemset whose support is greater than or equal to a *minsup* threshold

<i>TID</i>	<i>Items</i>
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

Definition: Association Rule

Association Rule

- An implication expression of the form $X \rightarrow Y$, where X and Y are itemsets
- Example:
 $\{\text{Milk, Diaper}\} \rightarrow \{\text{Beer}\}$

<i>TID</i>	<i>Items</i>
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Milk, Diaper, Beer, Bread
5	Milk, Diaper, Bread, Coke

Rule Evaluation Metrics

- Support (s)
Fraction of transactions that contain both X and Y
- Confidence (c)
Measures how often items in Y appear in transactions that contain X

Example:

$\{\text{Milk, Diaper}\} \Rightarrow \text{Beer}$

$$s = \frac{\sigma(\text{Milk, Diaper, Beer})}{|T|} = \frac{2}{5} = 0.4$$

$$c = \frac{\sigma(\text{Milk, Diaper, Beer})}{\sigma(\text{Milk, Diaper})} = \frac{2}{3} = 0.67$$

Association Rule Mining Task

Given a set of transactions T , the goal of association rule mining is to find all rules having

- support \geq ***minsup*** threshold
- confidence \geq ***minconf*** threshold

Brute-force approach:

- List all possible association rules
- Compute the support and confidence for each rule
- Prune rules that fail the ***minsup*** and ***minconf*** thresholds

⇒ Computationally prohibitive!

Mining Association Rules

<i>TID</i>	<i>Items</i>
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

Observations:

- All the above rules are binary partitions of the same itemset:
 {Milk, Diaper, Beer}
- Rules originating from the same itemset have identical support but can have different confidence
- Thus, we may decouple the support and confidence requirements

Example of Rules:

$\{\text{Milk, Diaper}\} \rightarrow \{\text{Beer}\}$ ($s=2/5$, $c=2/3$)
 $\{\text{Milk, Beer}\} \rightarrow \{\text{Diaper}\}$ ($s=2/5$, $c=2/2$)
 $\{\text{Diaper, Beer}\} \rightarrow \{\text{Milk}\}$ ($s=2/5$, $c=2/3$)
 $\{\text{Beer}\} \rightarrow \{\text{Milk, Diaper}\}$ ($s=2/5$, $c=2/3$)
 $\{\text{Diaper}\} \rightarrow \{\text{Milk, Beer}\}$ ($s=2/5$, $c=2/4$)
 $\{\text{Milk}\} \rightarrow \{\text{Diaper, Beer}\}$ ($s=2/5$, $c=2/4$)

Mining Association Rules

Two-step approach:

1. Frequent Itemset Generation

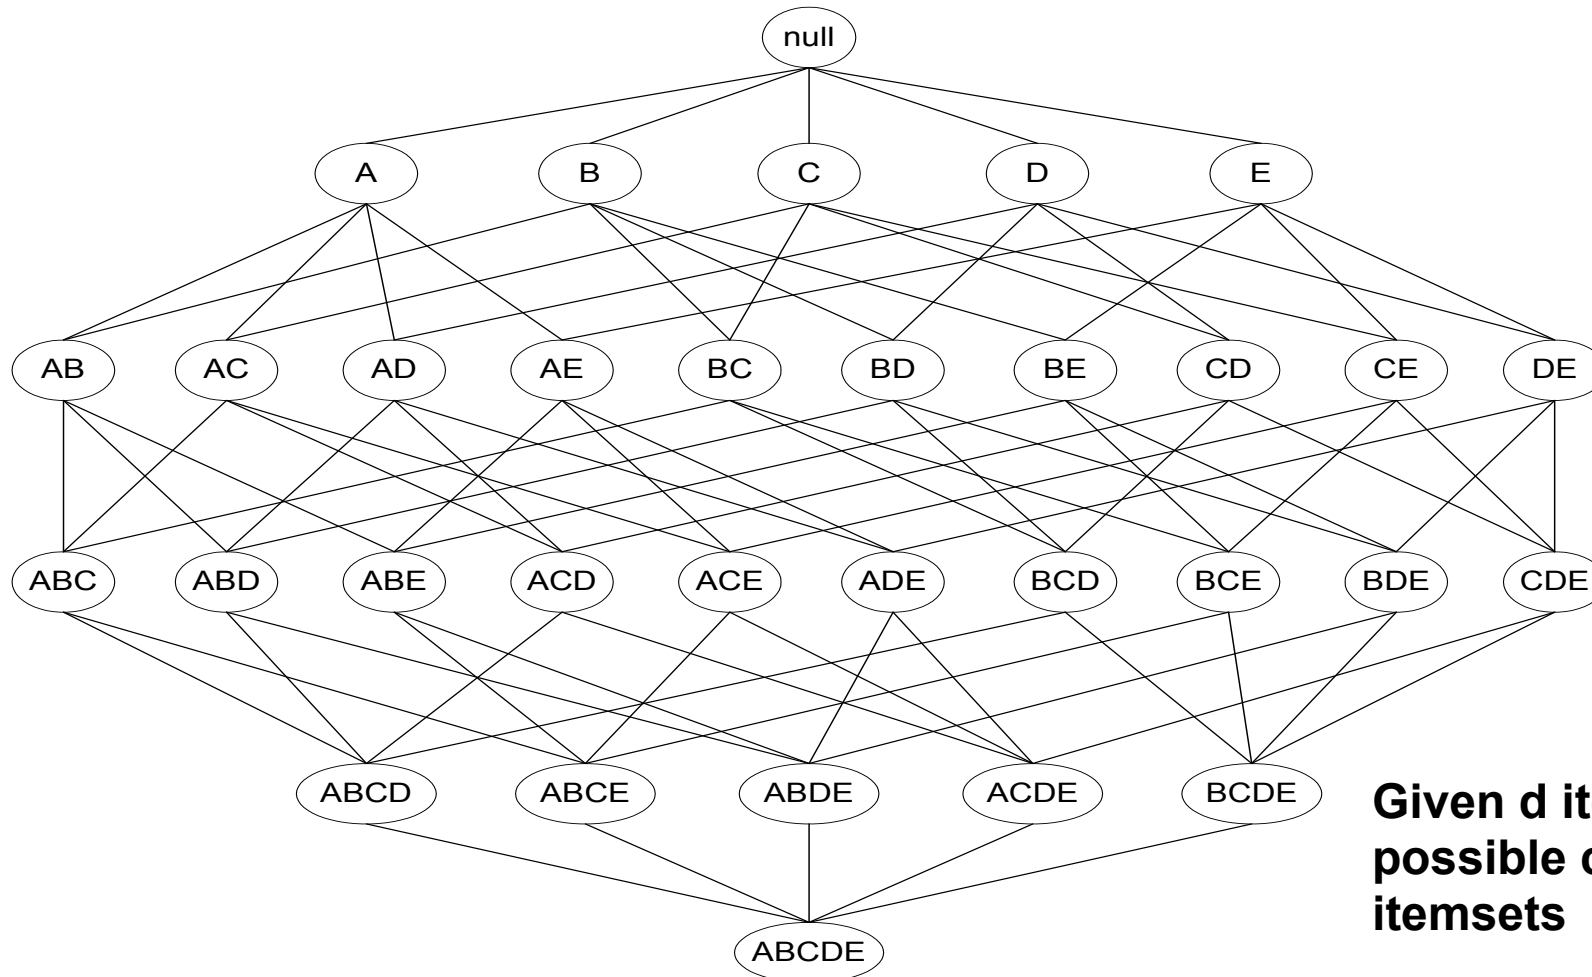

Generate all itemsets whose support \geq minsup

2. Rule Generation

Generate high confidence rules from each frequent itemset, where each rule is a binary partitioning of a frequent itemset

Frequent itemset generation is still computationally expensive

Frequent Itemset Generation

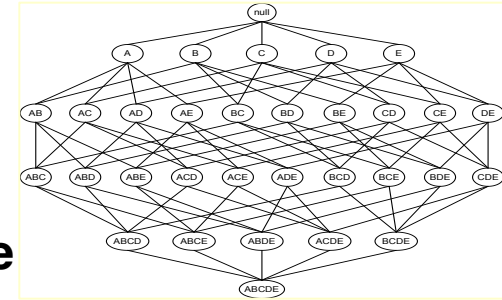

Given d items, there are 2^d possible candidate itemsets

Frequent Itemset Generation

Brute-force approach:

- Each itemset in the lattice is a candidate frequent itemset
- Count the support of each candidate by scanning the database

Lattice

Transactions

<i>TID</i>	<i>Items</i>
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

- Match
- Count

← W →

List of Candidates

candidate
 $M = 2^d$!!!

{Bread (Br)}
{Milk (M)}
...
{Br, M}
{Br, D}
...
{Br, M, D}
...
{Br, M, D, Be}
...
{Br, M, D, Be, C}
...
{Br, M, D, Be, C, E}

Computational Complexity

Given d unique items:

- Total number of itemsets = 2^d
- Total number of possible association rules:

#ways left side items
can be chosen out of d
items

#ways right side items
can be chosen using
the remaining $d-k$
items

$$R = \sum_{k=1}^{d-1} \left[\binom{d}{k} \times \sum_{j=1}^{d-k} \binom{d-k}{j} \right]$$

$$= 3^d - 2^{d+1} + 1$$

If $d=6$, $R = 602$ rules

An example $d=3$ and item set = {abc}

{a}	→ {b}	{a}	→ {c}	{a}	→ {bc}
{b}	→ {a}	{b}	→ {c}	{b}	→ {ac}
{c}	→ {a}	{c}	→ {b}	{c}	→ {ab}
{ab}	→ {c}	{ac}	→ {b}	{bc}	→ {a}

Frequent Itemset Generation Strategies

Reduce the number of candidates (M)

- Complete search: $M=2^d$
- Use pruning techniques to reduce M

Reduce the number of transactions (N)

- Reduce size of N as the size of itemset increases
- Used by DHP (Direct Hashing and Pruning) and vertical-based mining algorithms

Reduce the number of comparisons (NM)

- Use efficient data structures to store the candidates or transactions
- No need to match every candidate against every transaction

Reducing Number of Candidates

Apriori principle:

- If an itemset is frequent, then all of its subsets must also be frequent

Apriori principle holds due to the following property of the support measure:

$$\forall X, Y : (X \subseteq Y) \Rightarrow s(X) \geq s(Y)$$

Where $s(X)$ support of X

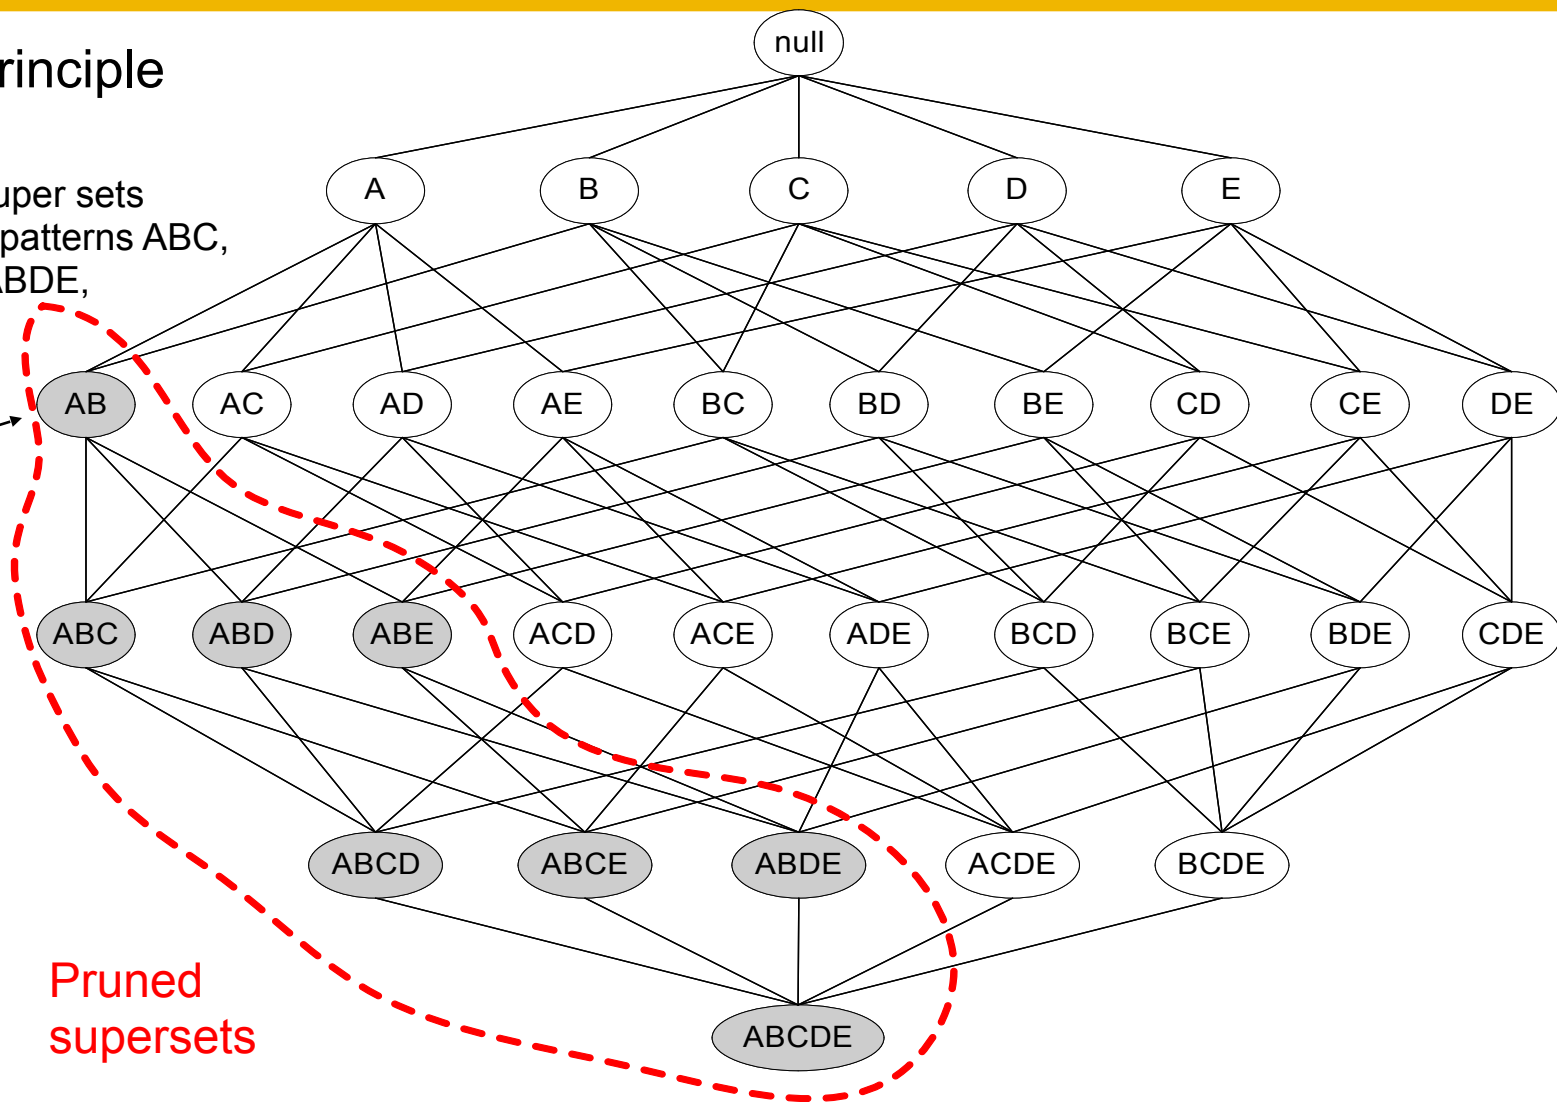

- Support of an itemset never exceeds the support of its subsets
- This is known as the **anti-monotone** property of support

Illustrating Apriori Principle

If AB is infrequent all its super sets are in frequent and hence patterns ABC, ABD, ABE, ABCD, ABCE, ABDE, ABCDE are all infrequent.

Found to be
Infrequent

Pruned
supersets

Illustrating Apriori Principle

Items (1-itemsets)

Item	Count
Bread	4
Coke	2
Milk	4
Beer	3
Diaper	4
Eggs	1

Minimum Support = 3

If every subset up to 3 itemsets are considered, Number of subsets = 6C_1 (itemset size of 1) + 6C_2 (itemset size of 2) + 6C_3 (itemset size of 3) = 41

With support-based pruning (see tables above),

$$6 + 6 + 1 = 13$$

Pairs (2-itemsets)

(No need to generate candidates involving Coke or Eggs as min support = 3)

Itemset	Count
{Bread,Milk}	3
{Bread,Beer}	2
{Bread,Diaper}	3
{Milk,Beer}	2
{Milk,Diaper}	3
{Beer,Diaper}	3

TID	Items
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

Triplets (3-itemsets)

Itemset	Count
{Bread,Milk,Diaper}	2

Apriori Algorithm

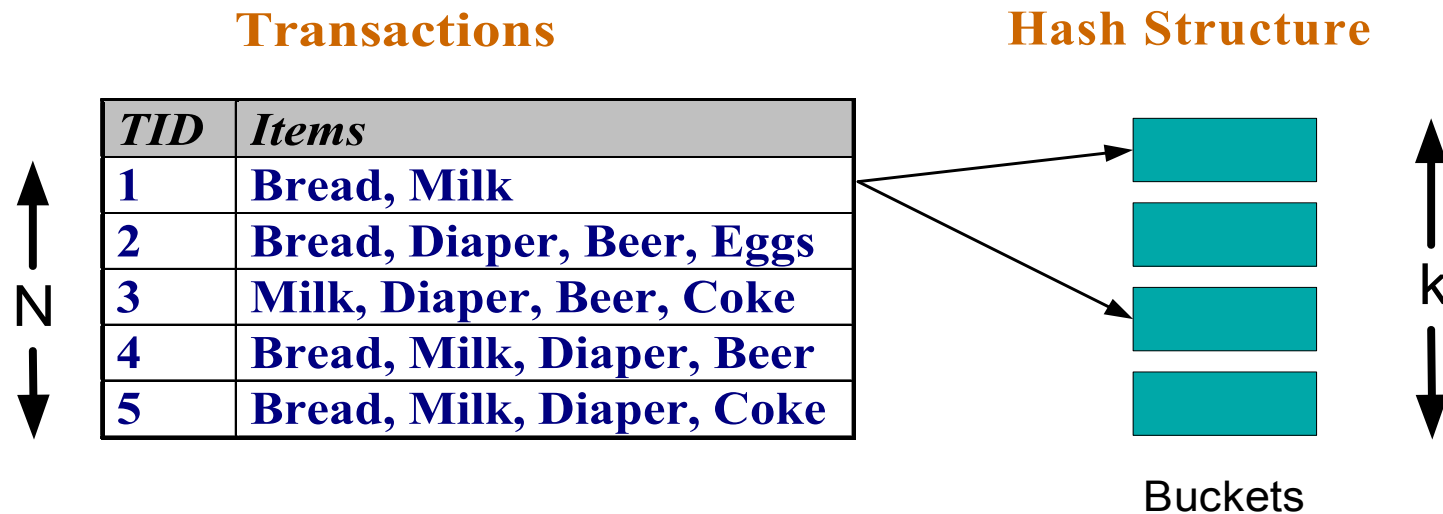

Method:

- Let $k=1$
- Generate frequent itemsets of length k
- Repeat until no new frequent itemsets are identified
 - Generate length $(k+1)$ candidate itemsets from length k frequent itemsets
 - Prune candidate itemsets containing subsets of length $k+1$ that are infrequent
 - Count the support of each candidate by scanning the DB
 - Eliminate candidates that are infrequent, leaving only those that are frequent

Reducing Number of Comparisons

Candidate counting:

- Scan the database of transactions to determine the support of each candidate itemset
- To reduce the number of comparisons, store the candidates in a hash structure
Instead of matching each transaction against every candidate, match it against candidates contained in the hashed buckets

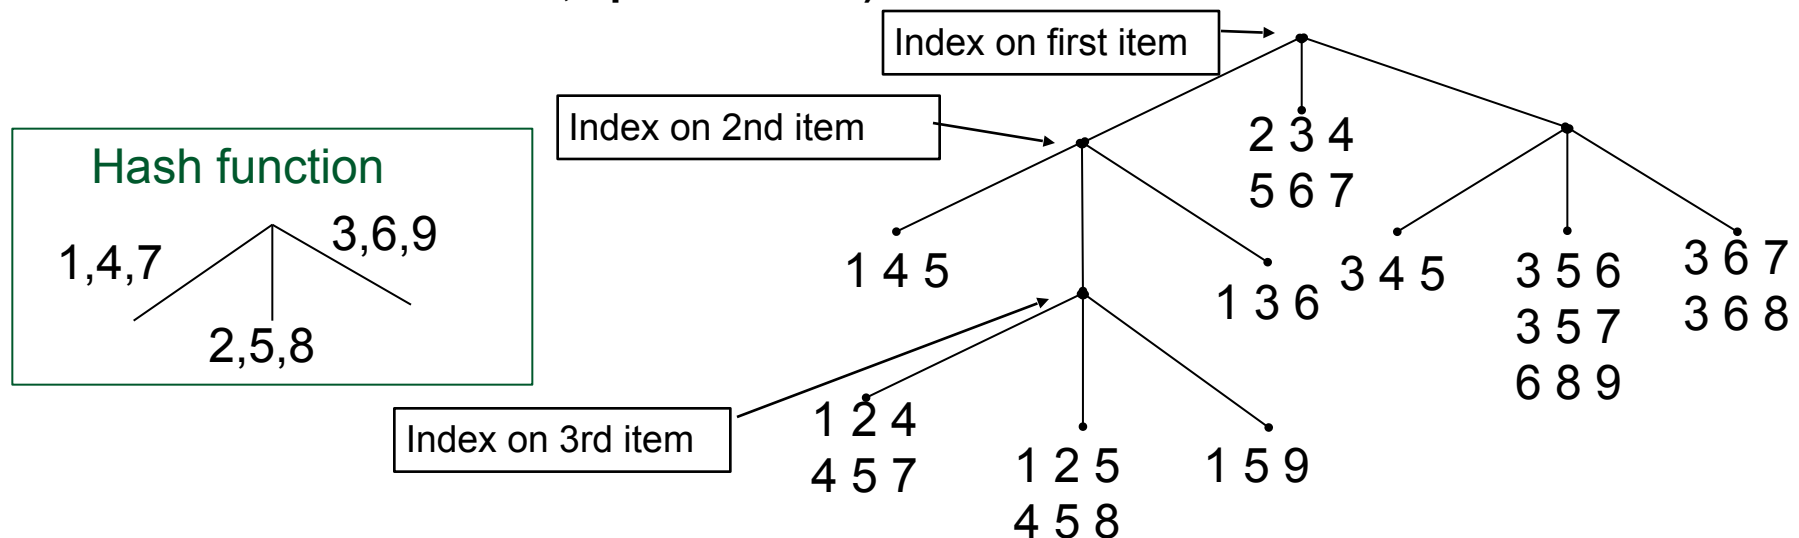

Generate Hash Tree

Suppose you have 15 candidate itemsets of length 3:

{1 4 5}, {1 2 4}, {4 5 7}, {1 2 5}, {4 5 8}, {1 5 9}, {1 3 6}, {2 3 4}, {5 6 7}, {3 4 5}, {3 5 6}, {3 5 7}, {6 8 9}, {3 6 7}, {3 6 8}

We need:

- Hash function
- Max leaf size: max number of itemsets stored in a leaf node (if number of candidate itemsets exceeds max leaf size, split the node)

Generate Hash Tree

Suppose you have 15 candidate itemsets of length 3:

{1 4 5}, {1 2 4}, {4 5 7}, {1 2 5}, {4 5 8}, {1 5 9}, {1 3 6}, {2 3 4}, {5 6 7}, {3 4 5}, {3 5 6}, {3 5 7}, {6 8 9}, {3 6 7}, {3 6 8}

f(1 or 4 or 7) = left branch
f(2 or 5 or 8) = middle branch
f(3 or 6 or 9) = right branch

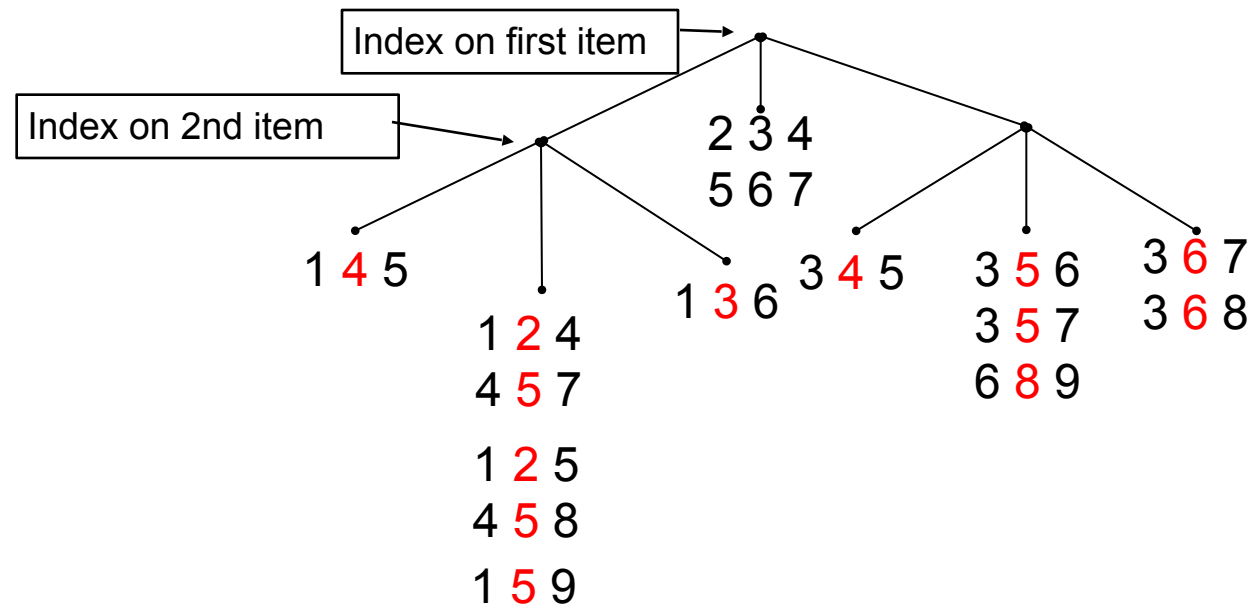

Generate Hash Tree

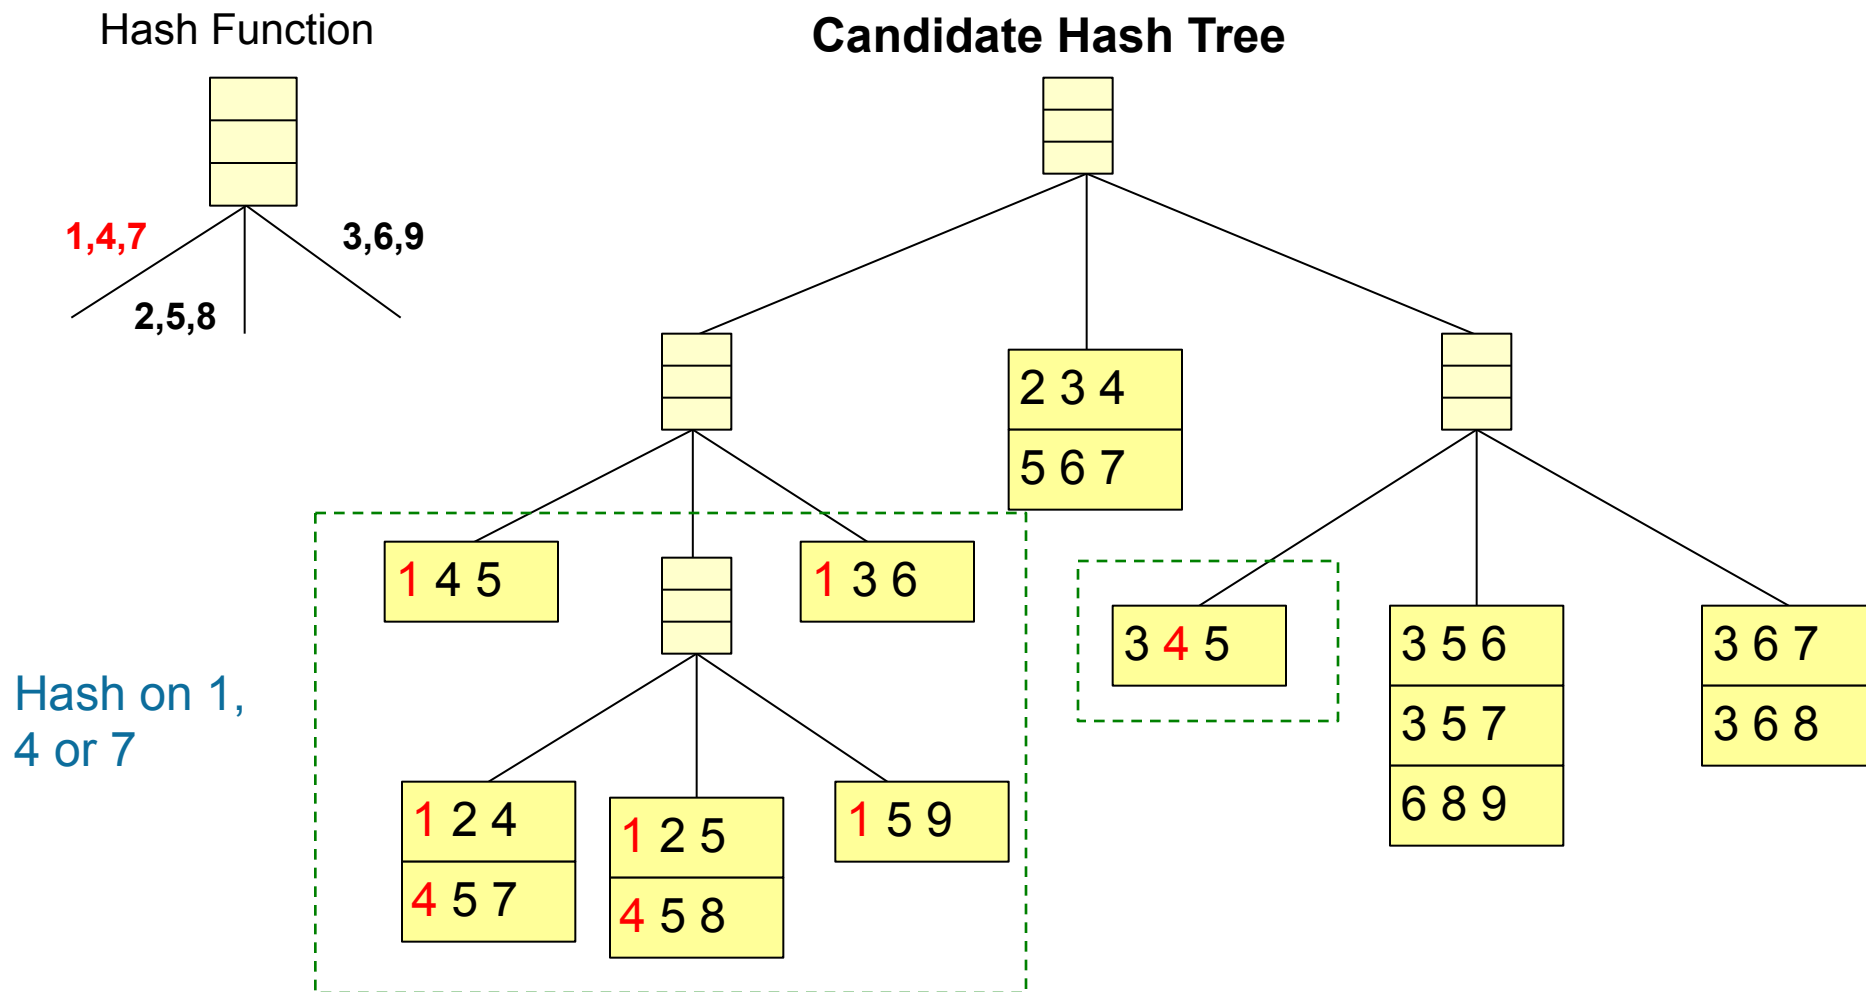

Suppose you have 15 candidate itemsets of length 3:

{1 4 5}, {1 2 4}, {4 5 7}, {1 2 5}, {4 5 8}, {1 5 9}, {1 3 6}, {2 3 4}, {5 6 7}, {3 4 5}, {3 5 6}, {3 5 7}, {6 8 9}, {3 6 7}, {3 6 8}

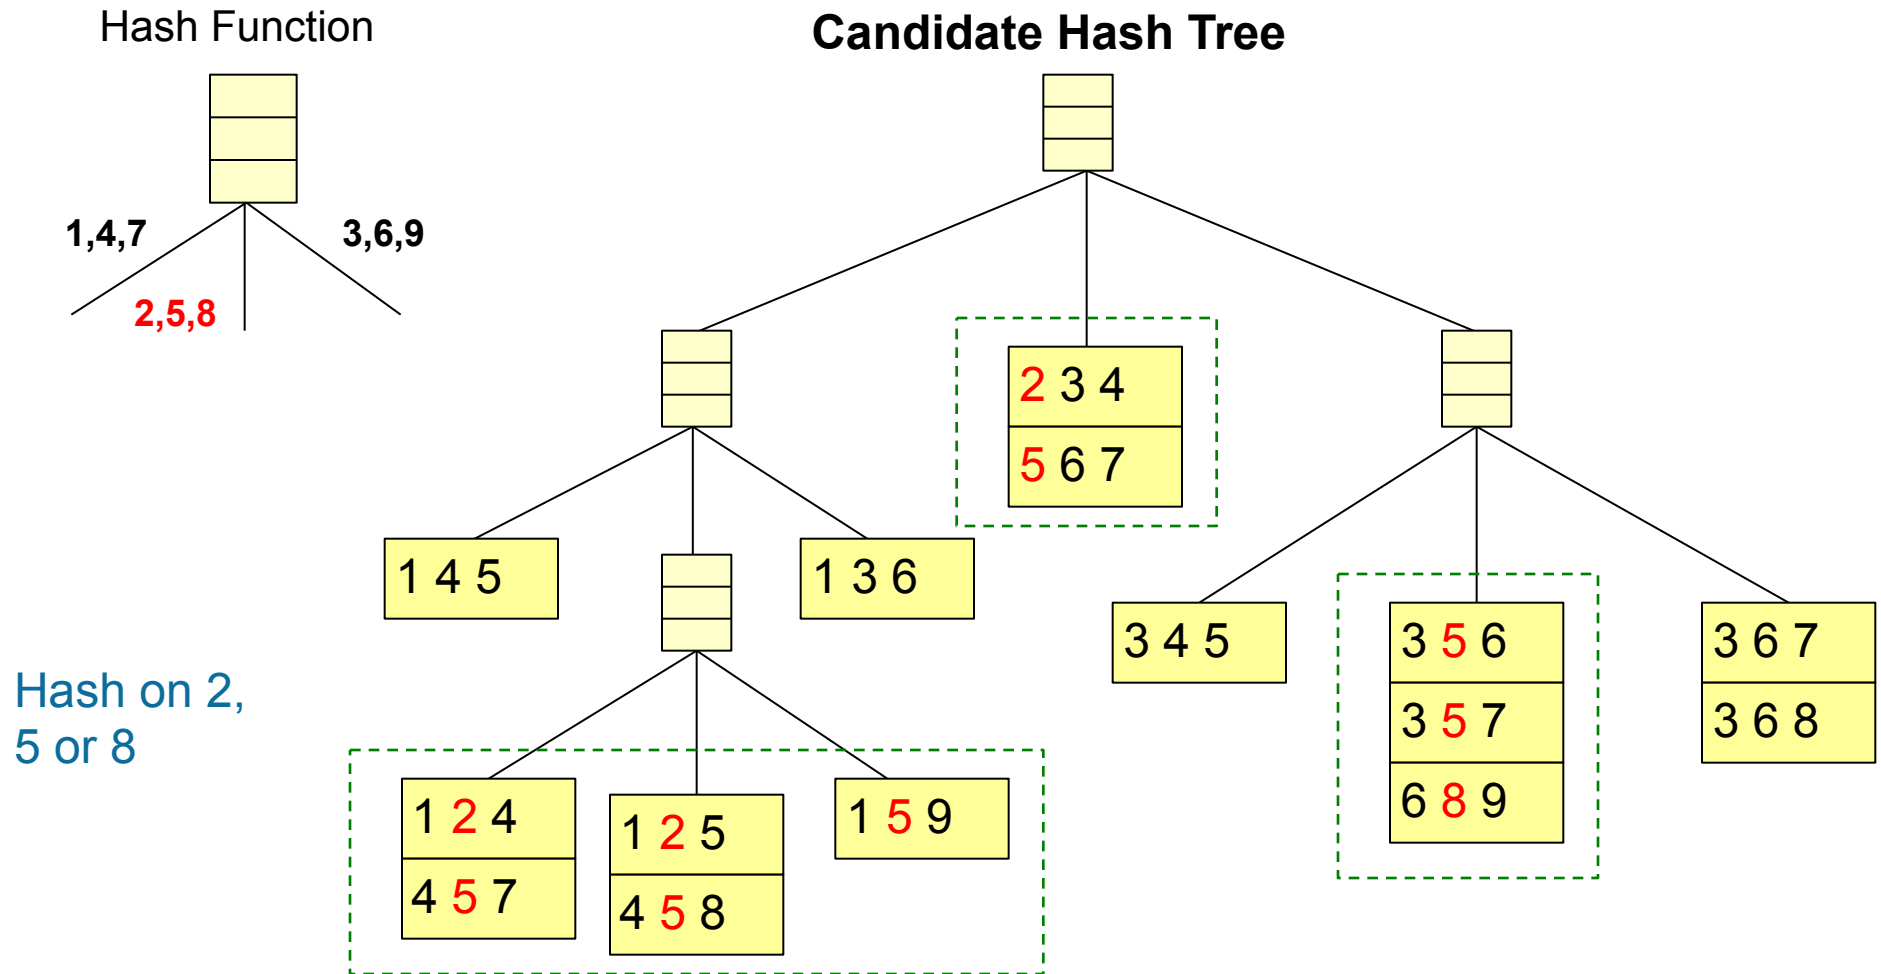

Hash function

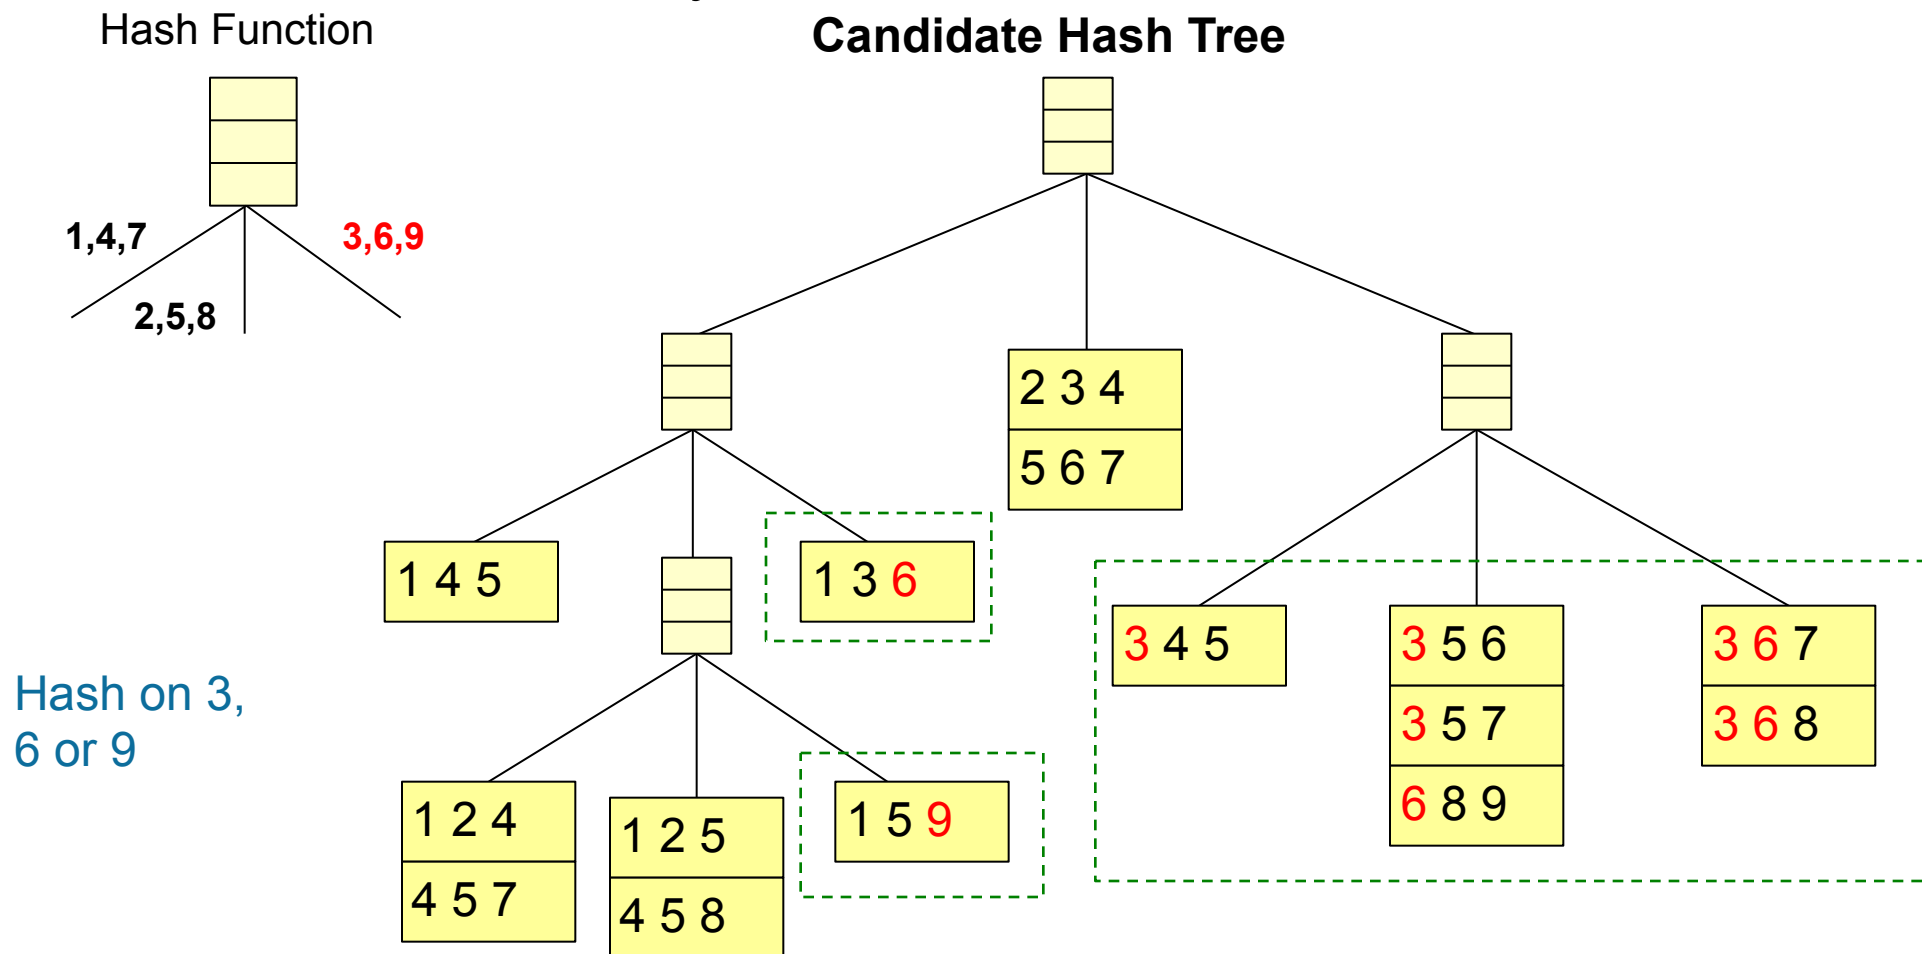

Association Rule Discovery: Hash tree

Association Rule Discovery: Hash tree

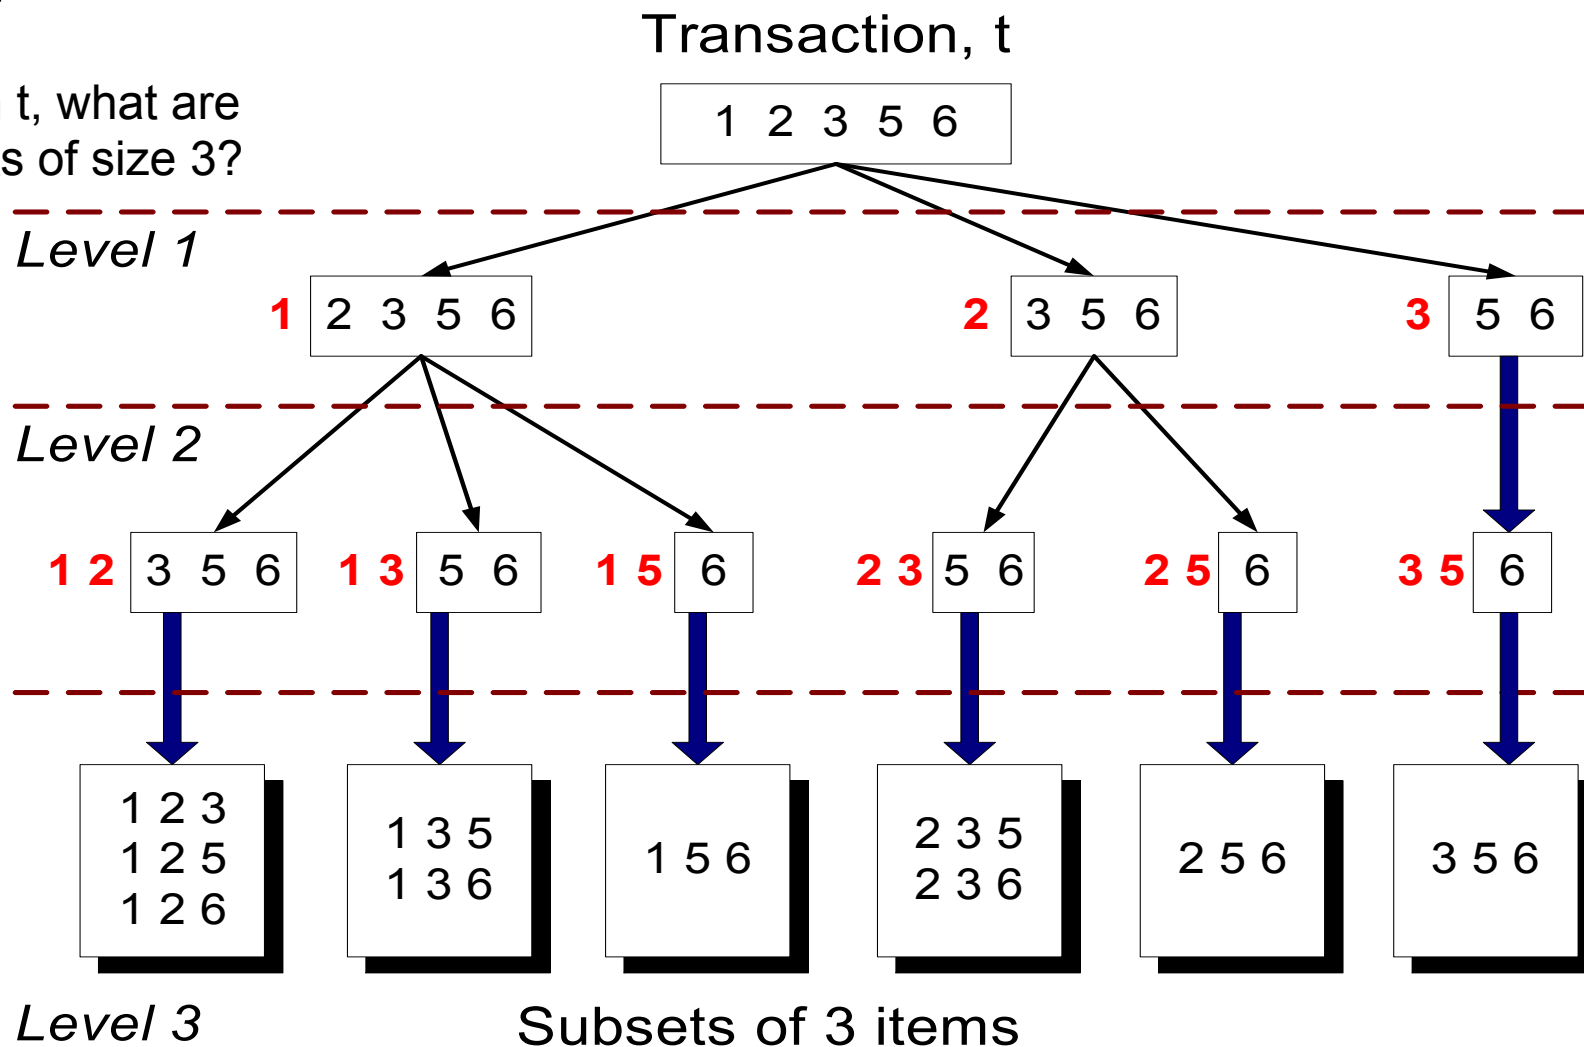

Association Rule Discovery: Hash tree

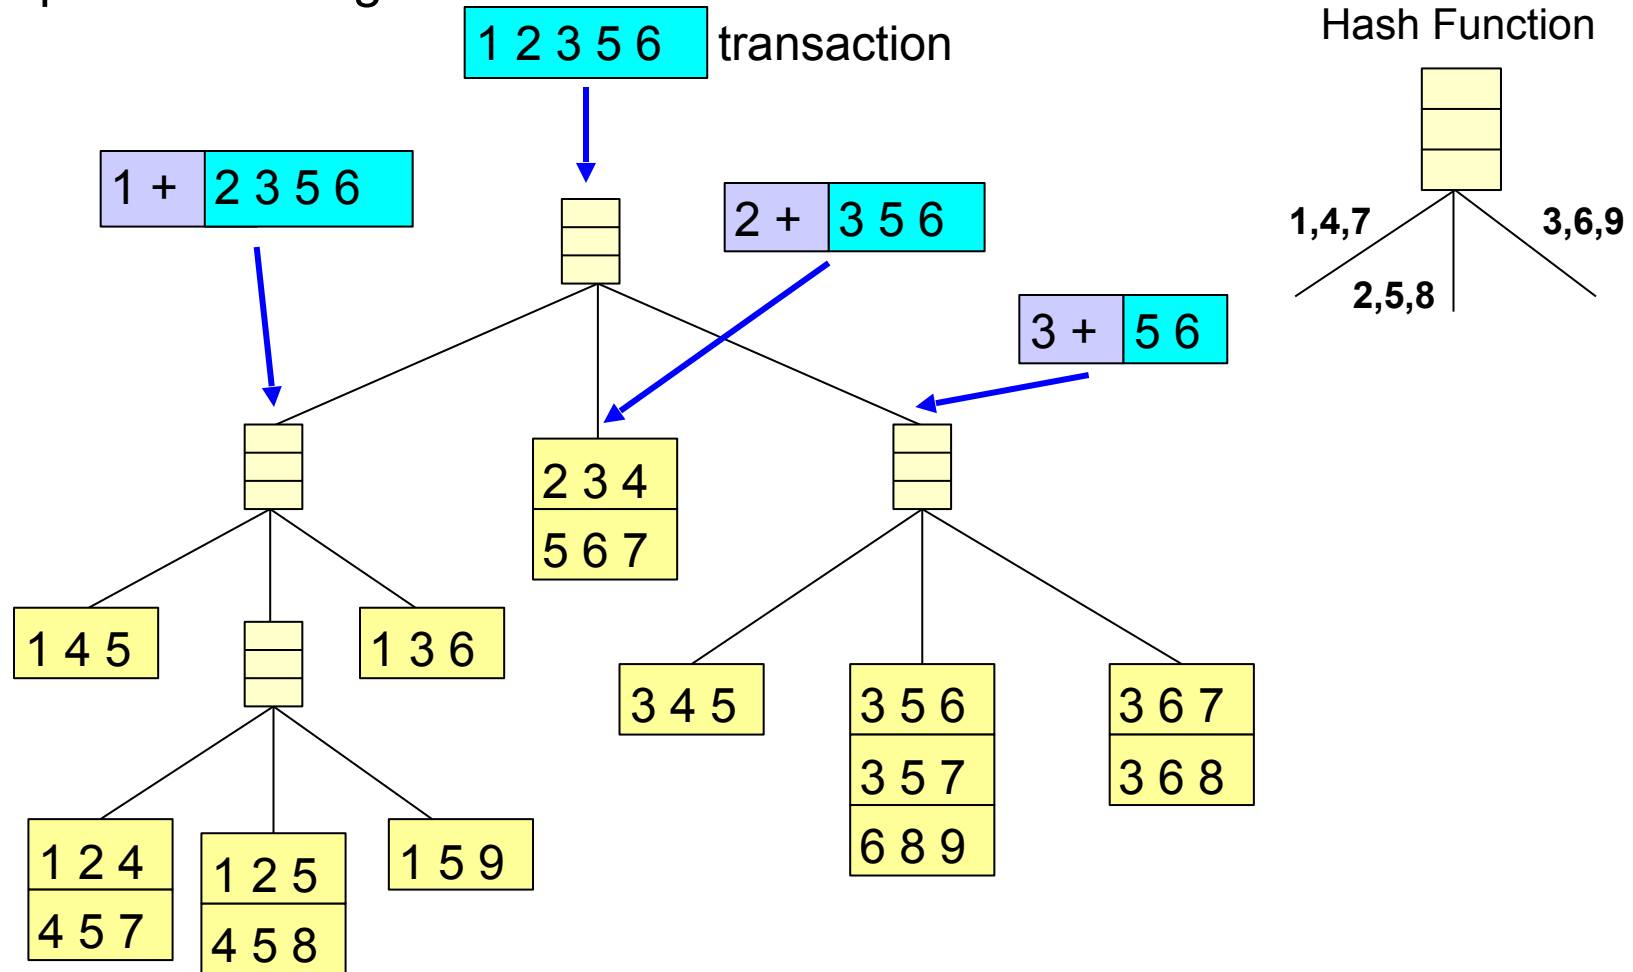

Subset Operation

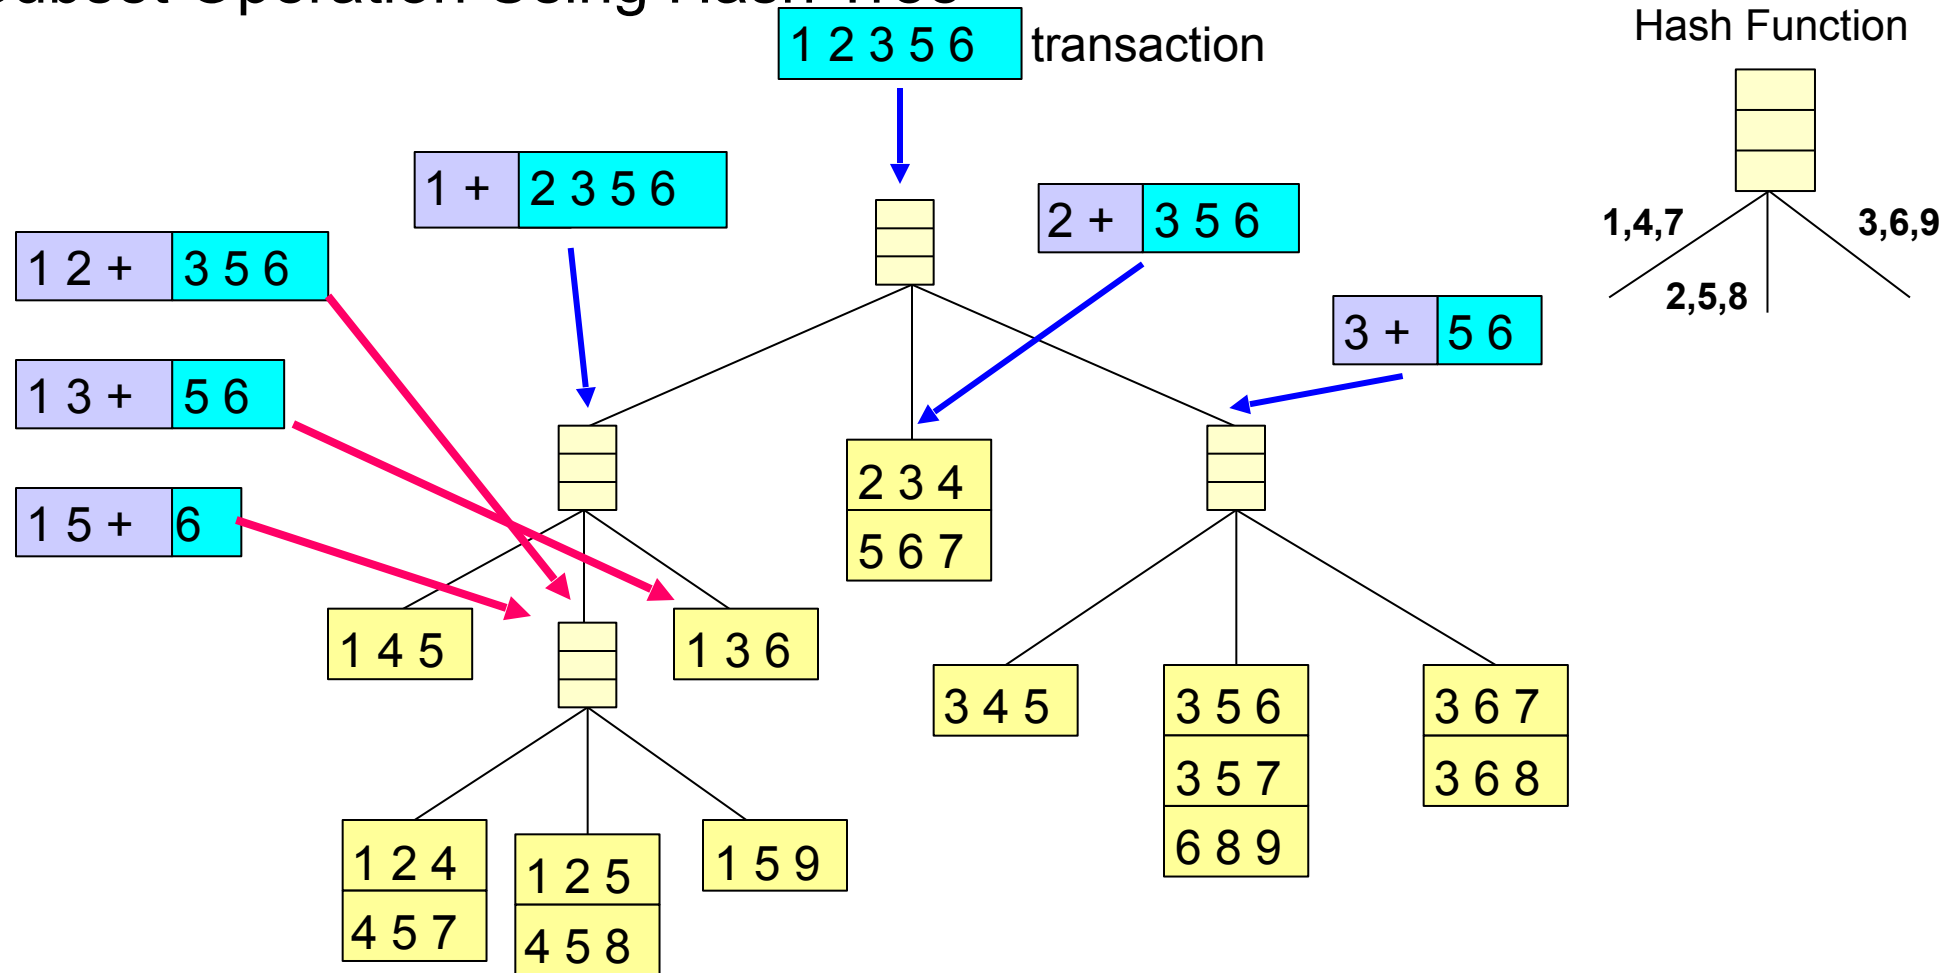

Given a transaction t , what are the possible subsets of size 3?

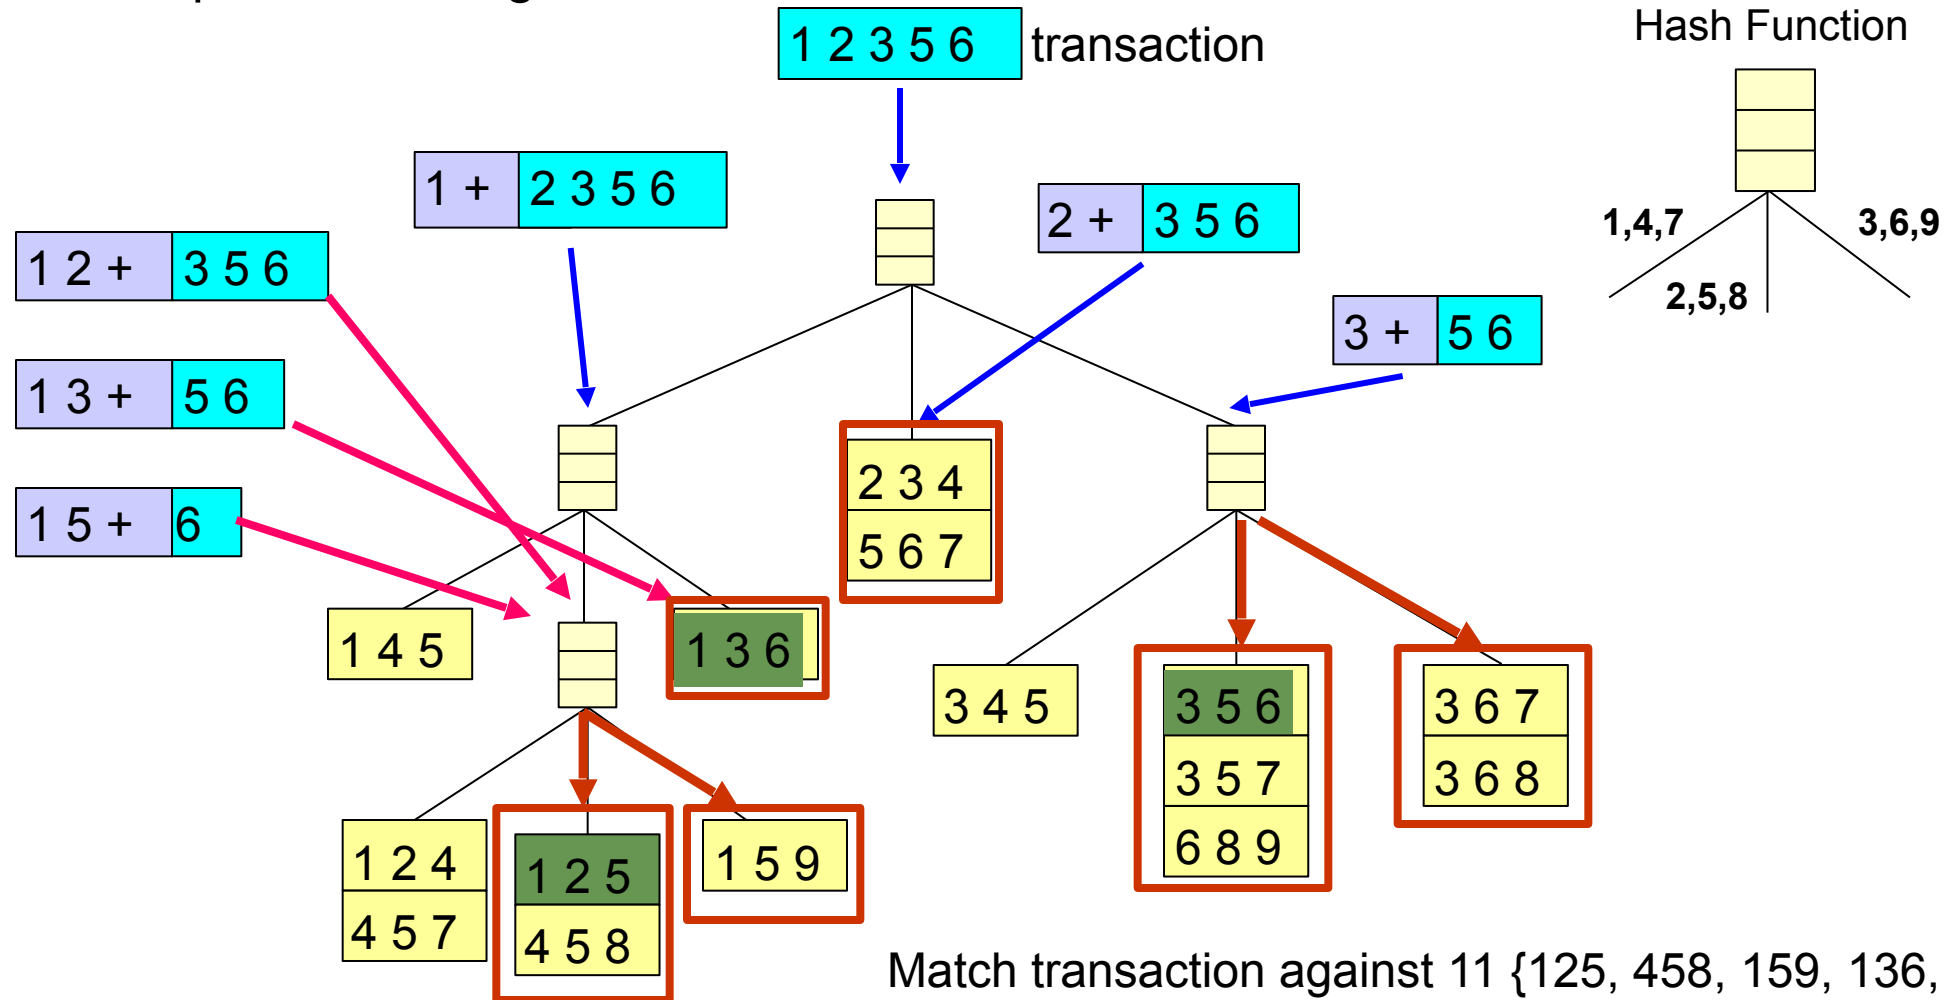

Subset Operation Using Hash Tree

Subset Operation Using Hash Tree

Subset Operation Using Hash Tree

Match transaction against 11 {125, 458, 159, 136, 234, 567, 356, 357, 689, 367, 368} out of 15 candidates.

Rule Generation

Given a frequent itemset L , find all non-empty subsets $F \subset L$ such that $F \rightarrow L - F$ satisfies the minimum confidence requirement

- If $\{A,B,C,D\}$ is a frequent itemset, candidate rules:

$A \rightarrow BCD$, $B \rightarrow ACD$, $C \rightarrow ABD$, $D \rightarrow ABC$

$AB \rightarrow CD$, $AC \rightarrow BD$, $AD \rightarrow BC$, $BC \rightarrow AD$,
 $BD \rightarrow AC$, $CD \rightarrow AB$,

$ABC \rightarrow D$, $ABD \rightarrow C$, $ACD \rightarrow B$, $BCD \rightarrow A$,

If $|L| = k$, then there are $2^k - 2$ candidate association rules (ignoring $L \rightarrow \emptyset$ and $\emptyset \rightarrow L$)

$$\text{Support}_D(X) = \frac{|\{x \mid X \subseteq x, x \in D\}|}{|D|} = p(X) \leq 1$$

Support of X in D is the proportion of records in D that have itemset X

$$\text{Confidence}_D(X \rightarrow Y) = p(Y \mid X) = \frac{\text{Support}_D(X \cup Y)}{\text{Support}_D(X)} \leq 1$$

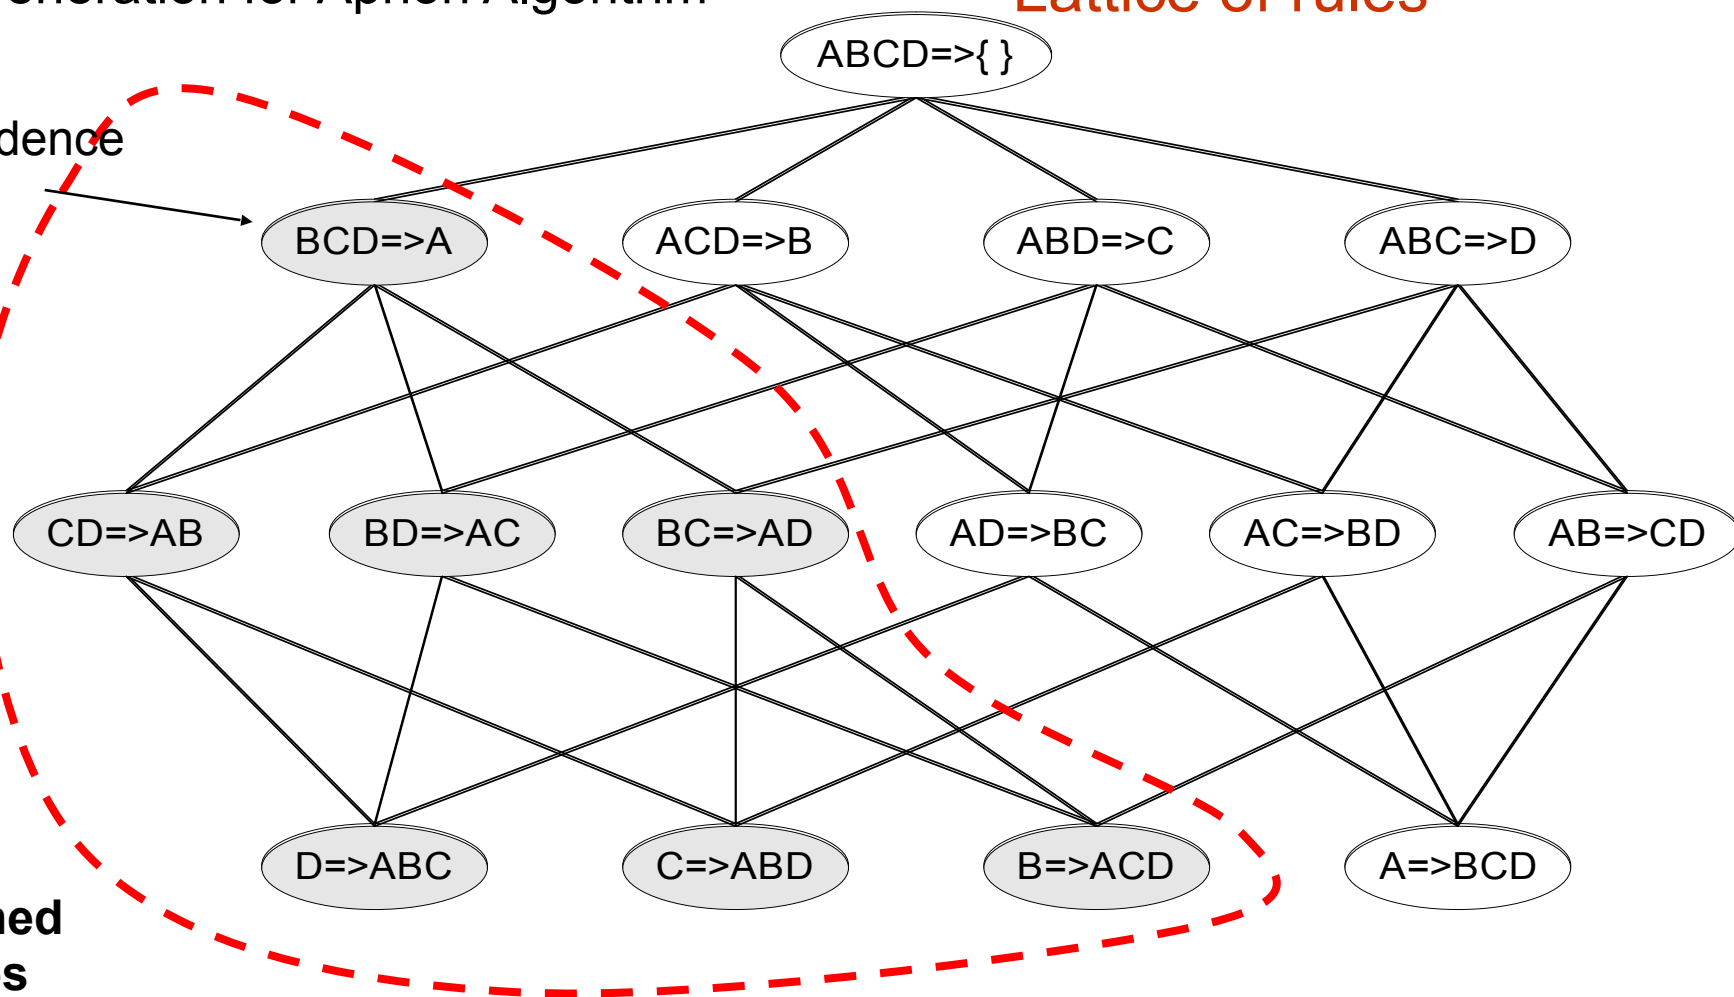

How to efficiently generate rules from frequent itemsets?

- In general, confidence does not have an anti-monotone property
 $c(ABC \rightarrow D)$ can be larger or smaller than $c(AB \rightarrow D)$
- But confidence of rules generated from the same itemset has an anti-monotone property
- e.g., $L = \{A, B, C, D\}$:
 $c(ABC \rightarrow D) = \text{sup}(ABCD)/\text{sup}(ABC) \geq c(AB \rightarrow CD) = \text{sup}(ABCD)/\text{sup}(AB) \geq$
 $c(A \rightarrow BCD) = \text{sup}(ABCD)/\text{sup}(A)$
 $\text{sup}(ABC) \leq \text{sup}(AB) \leq \text{sup}(A)$
Confidence is anti-monotone w.r.t. number of items on the RHS of the rule

Rule Generation for Apriori Algorithm

Lattice of rules

Low
Confidence
Rule

Pruned
Rules

Rule Generation for Apriori Algorithm

Candidate rule is generated by merging two rules that share the same prefix in the rule consequent

**join($CD \Rightarrow AB, BD \Rightarrow AC$)
would produce the candidate
rule $D \Rightarrow ABC$**

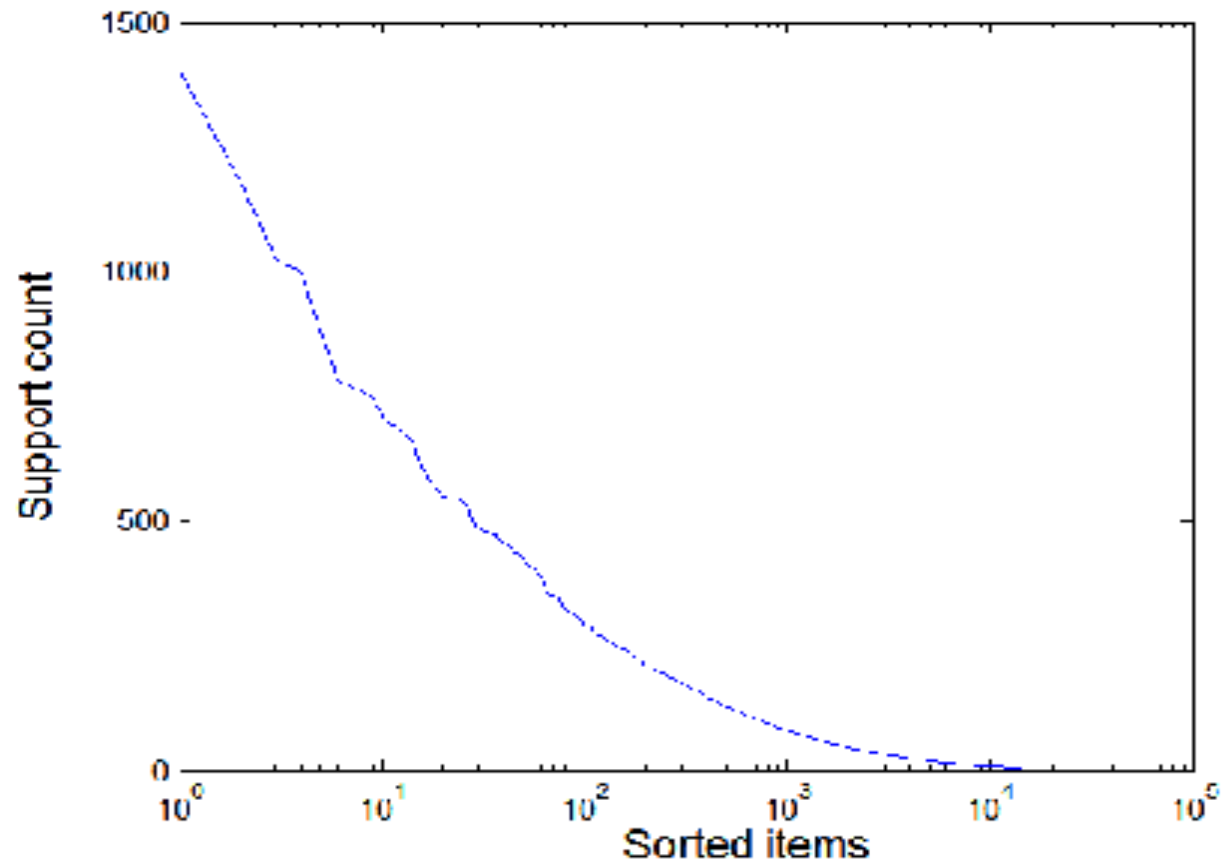

**Prune rule $D \Rightarrow ABC$ if its
subset $AD \Rightarrow BC$ does not have
high confidence**

Effect of Support Distribution

Many real data sets have skewed support distribution

**Support
distribution of a
retail data set**

The rest of slides would be of great interest for you to read but due to lack of time the rest of the slides are not covered in the lectures and are also not examinable. If you have time and interest and I recommend you to study these slides!

Please watch the following video with regard to AI and Data Mining on 19 May 2017 by Google CEO: Sundar Pichai <https://www.recode.net/2017/5/19/15666704/google-lens-key-example-ai-first-computer-vision>

- I will be away on 6 June 2017
- I am available generally from next week: Monday morning; Tuesday afternoon; Wednesday morning; Friday morning for consultation. Please come in groups as it will be useful for many.

Effect of Support Distribution

How to set the appropriate *minsup* threshold?

- If *minsup* is set too high, we could miss itemsets involving interesting rare items (e.g., expensive products)
- If *minsup* is set too low, it is computationally expensive and the number of itemsets is very large

Using a single minimum support threshold may not be effective

Factors Affecting Complexity

Choice of minimum support threshold

- lowering support threshold results in more frequent itemsets
- this may increase number of candidates and max length of frequent itemsets

Dimensionality (number of items) of the data set

- more space is needed to store support count of each item
- if number of frequent items also increases, both computation and I/O costs may also increase

Size of database

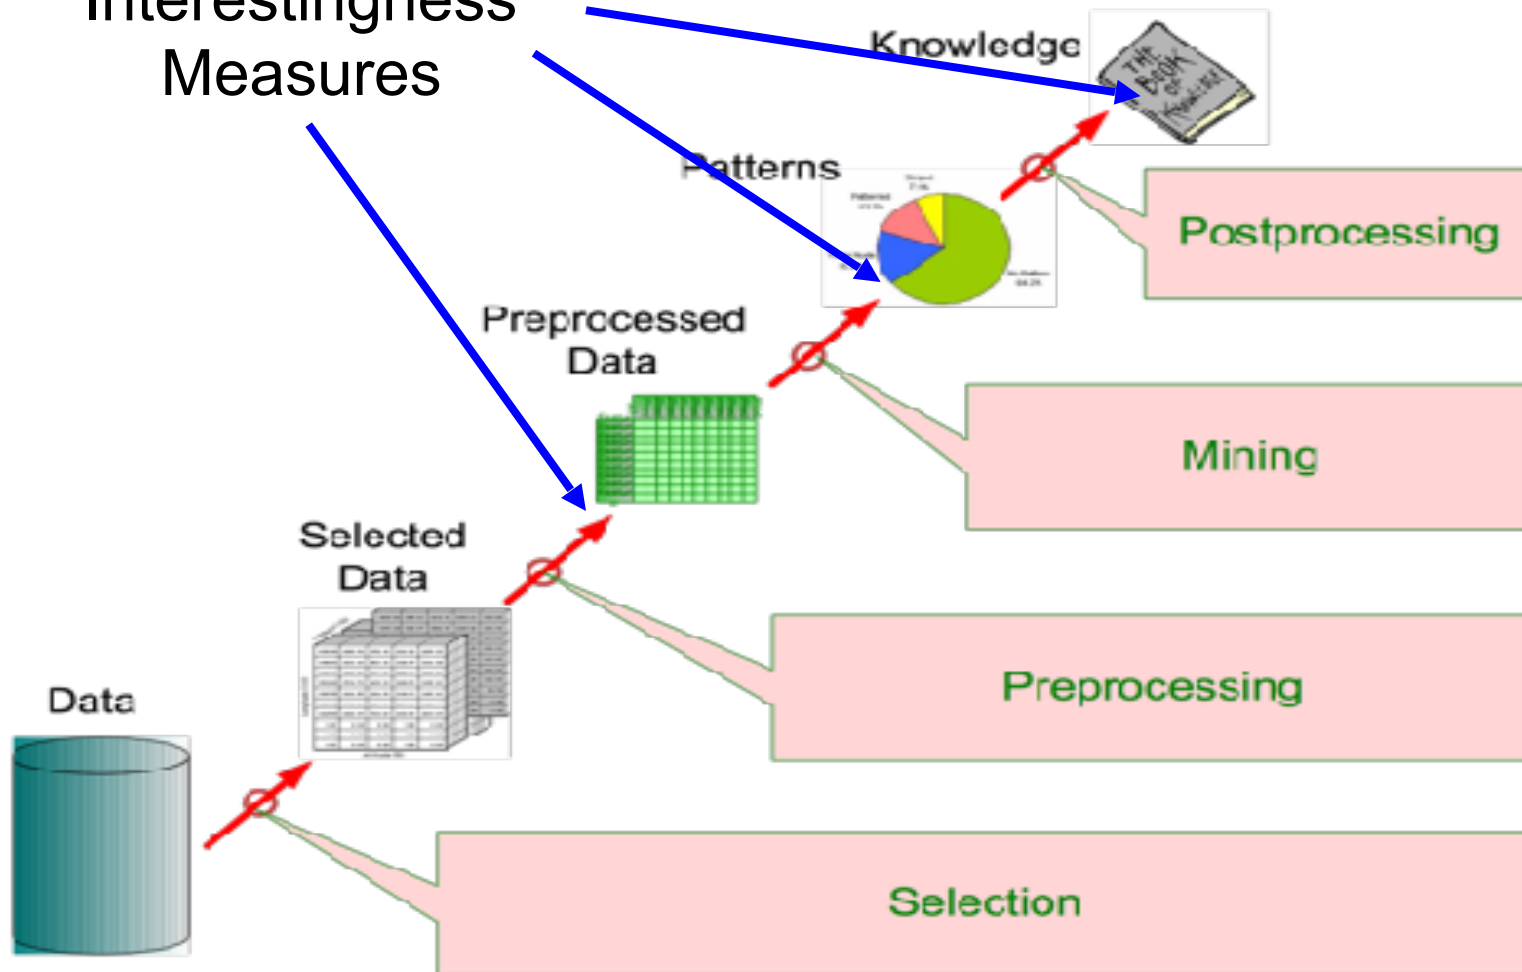

- since Apriori makes multiple passes, run time of algorithm may increase with number of transactions

Average transaction width

- transaction width increases with denser data sets
- This may increase max length of frequent itemsets and traversals of hash tree (number of subsets in a transaction increases with its width)

Application of Interestingness Measure

Interestingness Measures

Pattern Evaluation

Association rule algorithms tend to produce too many rules

- many of them are uninteresting or redundant
- Redundant if $\{A,B,C\} \rightarrow \{D\}$ and $\{A,B\} \rightarrow \{D\}$ have same support & confidence

Interestingness measures can be used to prune/rank the derived patterns

In the original formulation of association rules, support & confidence are the only measures used

Computing Interestingness Measure

Given a rule $X \rightarrow Y$, information needed to compute rule interestingness can be obtained from a contingency table

Contingency table for $X \rightarrow Y$

	Y	\overline{Y}	
X	f_{11}	f_{10}	f_{1+}
\overline{X}	f_{01}	f_{00}	f_{0+}
	f_{+1}	f_{+0}	$ T $

f_{11} : support of X and Y

f_{10} : support of \underline{X} and \overline{Y}

f_{01} : support of \overline{X} and \underline{Y}

f_{00} : support of X and Y

Used to define various measures

? support, confidence, lift, Gini, J-measure, etc.

Drawback of Confidence

$$Support_D(X) = \frac{|\{x \mid X \subseteq x, x \in D\}|}{|D|} = p(X) \leq 1$$

Support of X in D is the proportion of records in D that have itemset X

$$Confidence_D(X \rightarrow Y) = p(Y \mid X) = \frac{Support_D(X \cup Y)}{Support_D(X)} \leq 1$$

	Coffee	<u>Coffee</u>	
Tea	15	5	20
<u>Tea</u>	75	5	80
	90	10	100

Association Rule: Tea \rightarrow Coffee

Confidence = $P(\text{Coffee} \mid \text{Tea}) = 0.75$

but $P(\text{Coffee}) = 0.9$

\Rightarrow Although confidence is high, rule is misleading

$\Rightarrow P(\text{Coffee} \mid \overline{\text{Tea}}) = 0.9375$

Statistical Independence

Population of 1000 students

- 600 students know how to swim (S)
- 700 students know how to bike (B)
- 420 students know how to swim and bike (S,B)

- $P(S \cap B) = 420/1000 = 0.42$
- $P(S) \times P(B) = 0.6 \times 0.7 = 0.42$

- $P(S \cap B) = P(S) \times P(B) \Rightarrow$ Statistical independence
- $P(S \cap B) > P(S) \times P(B) \Rightarrow$ Positively correlated
- $P(S \cap B) < P(S) \times P(B) \Rightarrow$ Negatively correlated

Statistical-based Measures

Measures that take into account
statistical dependence

$$\textit{Lift also called Interest} = \frac{P(Y | X)}{P(Y)} = \frac{P(X, Y)}{P(X)P(Y)}$$

$$PS = P(X, Y) - P(X)P(Y)$$

$$\phi - \textit{coefficient} = \frac{P(X, Y) - P(X)P(Y)}{\sqrt{P(X)[1 - P(X)]P(Y)[1 - P(Y)]}}$$

Compact Representation of Frequent Itemsets

Some itemsets are redundant because they have identical support as their supersets

TID-list

ECLAT

Determine support of any k -itemset by intersecting tid-lists of two of its $(k-1)$ subsets.

3 traversal approaches:

- top-down, bottom-up and hybrid

Advantage: very fast support counting

Disadvantage: intermediate tid-lists may become too large for memory

Multiple Minimum Support

How to apply multiple minimum supports?

- $MS(i)$: minimum support for item i
- e.g.: $MS(\text{Milk})=5\%$, $MS(\text{Coke}) = 3\%$,
 $MS(\text{Broccoli})=0.1\%$, $MS(\text{Salmon})=0.5\%$
- $MS(\{\text{Milk}, \text{Broccoli}\}) = \min (MS(\text{Milk}), MS(\text{Broccoli}))$
 $= 0.1\%$
- Challenge: Support is no longer anti-monotone
Suppose: $\text{Support}(\text{Milk}, \text{Coke}) = 1.5\%$ and
 $\text{Support}(\text{Milk}, \text{Coke}, \text{Broccoli}) = 0.5\%$

 $\{\text{Milk}, \text{Coke}\}$ is infrequent but $\{\text{Milk}, \text{Coke}, \text{Broccoli}\}$ is frequent due to different minimum support requirements!

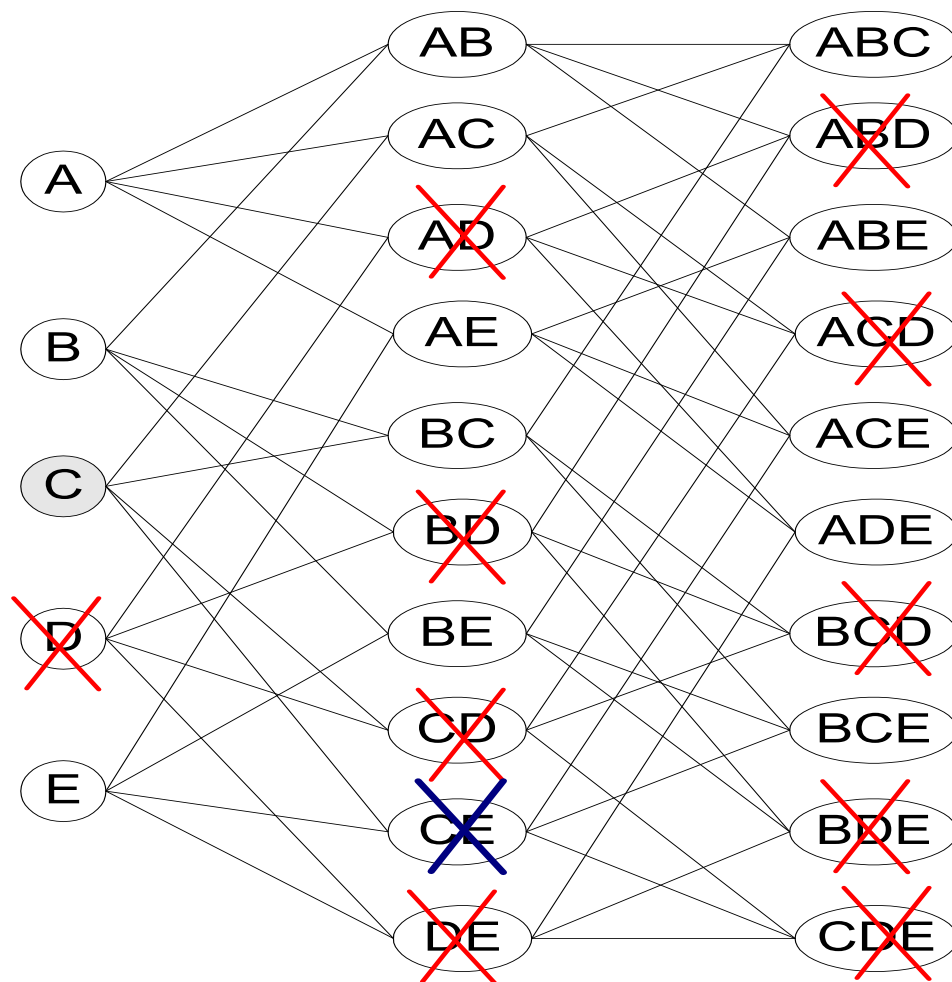

Multiple Minimum Support

Item	MS(I)	Sup(I)
A	0.10%	0.25%
B	0.20%	0.26%
C	0.30%	0.29%
D	0.50%	0.05%
E	3%	4.20%

Multiple Minimum Support

Item	MS(I)	Sup(I)
A	0.10%	0.25%
B	0.20%	0.26%
C	0.30%	0.29%
D	0.50%	0.05%
E	3%	4.20%

Multiple Minimum Support (Liu 1999)

Order the items according to their minimum support (in ascending order)

- e.g.: $MS(\text{Milk})=5\%$, $MS(\text{Coke}) = 3\%$,
 $MS(\text{Broccoli})=0.1\%$, $MS(\text{Salmon})=0.5\%$
- Ordering: Broccoli, Salmon, Coke, Milk

Need to modify Apriori such that:

- L_1 : set of frequent items
- F_1 : set of items whose support is $\geq MS(1)$
where $MS(1)$ is $\min_i(MS(i))$
- C_2 : candidate itemsets of size 2 is generated from F_1
instead of L_1

Multiple Minimum Support (Liu 1999)

Modifications to Apriori:

- In traditional Apriori,
 - A candidate $(k+1)$ -itemset is generated by merging two frequent itemsets of size k
 - The candidate is pruned if it contains any infrequent subsets of size k
- Pruning step has to be modified:
 - Prune only if subset contains the first item
 - e.g.: Candidate = {Broccoli, Coke, Milk} (ordered according to minimum support)
 - {Broccoli, Coke} and {Broccoli, Milk} are frequent but {Coke, Milk} is infrequent
 - Candidate is not pruned because {Coke, Milk} does not contain the first item, i.e., Broccoli.

Example: Lift/Interest

	Coffee	Coffee	
Tea	15	5	20
Tea	75	5	80
	90	10	100

Association Rule: Tea \rightarrow Coffee

Confidence= $P(\text{Coffee}|\text{Tea}) = 0.75$

but $P(\text{Coffee}) = 0.9$

$\Rightarrow \text{Lift} = 0.75/0.9 = 0.8333 (< 1, \text{ therefore is negatively associated})$

Drawback of Lift & Interest

	Y	\overline{Y}	
X	10	0	10
\overline{X}	0	90	90
	10	90	100

$$Lift = \frac{1.0}{0.1} = 10$$

$$Lift \text{ also called } Interest = \frac{P(Y | X)}{P(Y)} = \frac{P(X, Y)}{P(X)P(Y)}$$

$$PS = P(X, Y) - P(X)P(Y)$$

$$\phi - coefficient = \frac{P(X, Y) - P(X)P(Y)}{\sqrt{P(X)[1 - P(X)]P(Y)[1 - P(Y)]}}$$

	Y	\overline{Y}	
X	90	0	90
\overline{X}	0	10	10
	90	10	100

$$Lift = \frac{1.0}{0.9} = 1.11$$

Statistical independence:

If $P(X, Y) = P(X)P(Y) \Rightarrow Lift = 1$

There are lots of measures proposed in the literature

Some measures are good for certain applications, but not for others

What criteria should we use to determine whether a measure is good or bad?

What about Apriori-style support based pruning? How does it affect these measures?

#	Measure	Formula
1	ϕ -coefficient	$\frac{P(A,B) - P(A)P(B)}{\sqrt{P(A)P(B)(1-P(A))(1-P(B))}}$
2	Contingency-Kruskal's (λ)	$\frac{\sum_i \max_j P(A_i, B_k) - \sum_k \max_j P(A_j, B_k) - \max_j P(A_j) - \max_k P(B_k)}{2 \max_j P(A_j) \max_k P(B_k)}$
3	Odds ratio (α)	$\frac{P(A,B)P(\bar{A},\bar{B})}{P(A,\bar{B})P(\bar{A},B)}$
4	Yule's Q	$\frac{P(A,B)P(\bar{A}\bar{B}) - P(A,\bar{B})P(\bar{A},B)}{P(A,B)P(\bar{A}\bar{B}) + P(A,\bar{B})P(\bar{A},B)} = \frac{\alpha-1}{\alpha+1}$
5	Yule's Y	$\frac{\sqrt{P(A,B)P(\bar{A}\bar{B})} - \sqrt{P(A,\bar{B})P(\bar{A},B)}}{\sqrt{P(A,B)P(\bar{A}\bar{B})} + \sqrt{P(A,\bar{B})P(\bar{A},B)}} = \frac{\sqrt{\alpha}-1}{\sqrt{\alpha}+1}$
6	Kappa (κ)	$\frac{P(A,B) + P(\bar{A},\bar{B}) - P(A)P(B) - P(\bar{A})P(\bar{B})}{1 - P(A)P(B) - P(\bar{A})P(\bar{B})}$
7	Mutual Information (M)	$\frac{\sum_i \sum_j P(A_i, B_j) \log \frac{P(A_i, B_j)}{P(A_i)P(B_j)}}{\min(-\sum_i P(A_i) \log P(A_i), -\sum_j P(B_j) \log P(B_j))}$
8	J-Measure (J)	$\max \left(I'(A, B) \log \left(\frac{P(B A)}{P(B)} \right) + I'(\bar{A}\bar{B}) \log \left(\frac{P(\bar{B} \bar{A})}{P(\bar{B})} \right), \right. \\ \left. P(A, B) \log \left(\frac{P(A B)}{P(A)} \right) + P(\bar{A}\bar{B}) \log \left(\frac{P(\bar{A} \bar{B})}{P(\bar{A})} \right) \right)$
9	Gini index (G)	$\max \left(P(A) [P(B A)^2 + P(\bar{B} A)^2] + P(\bar{A}) [P(B \bar{A})^2 + P(\bar{B} \bar{A})^2] \right. \\ \left. - P(B)^2 - P(\bar{B})^2, \right. \\ \left. P(B) [P(A B)^2 + P(\bar{A} B)^2] + P(\bar{B}) [P(A \bar{B})^2 + P(\bar{A} \bar{B})^2] \right. \\ \left. - P(A)^2 - P(\bar{A})^2 \right)$
10	Support (s)	$P(A, B)$
11	Confidence (c)	$\max(P(B A), P(A B))$
12	Laplace (L)	$\max \left(\frac{NP(A,B) + 1}{NP(A) + 2}, \frac{NP(A,B) + 1}{NP(B) + 2} \right)$
13	Conviction (V)	$\max \left(\frac{P(A)P(\bar{B})}{P(\bar{A}B)}, \frac{P(B)P(\bar{A})}{P(A\bar{B})} \right)$
14	Interest (I)	$\frac{P(A,B)}{P(A)P(B)}$
15	cosine (IS)	$\frac{P(A,B)}{\sqrt{P(A)P(B)}}$
16	Piatetsky-Shapiro's (PS)	$P(A, B) - P(A)P(B)$
17	Certainty factor (F)	$\max \left(\frac{P(B A) - P(B)}{1 - P(B)}, \frac{P(A B) - P(A)}{1 - P(A)} \right)$
18	Added Value (AV)	$\max(I'(B A) - I'(B), I'(A B) - I'(A))$
19	Collective strength (S)	$\frac{P(A,B) + P(\bar{A}\bar{B})}{P(A)P(B) + P(\bar{A})P(\bar{B})} \times \frac{1 - P(A)P(B) - P(\bar{A})P(\bar{B})}{1 - P(A,B) - P(\bar{A}\bar{B})}$
20	Jaccard (ζ)	$\frac{P(A,B)}{P(A) + P(B) - P(A,B)}$
21	Klosgen (K)	$\sqrt{P(A,B)} \max(P(B A) - P(B), P(A B) - P(A))$

Properties of A Good Measure

Piatetsky-Shapiro:

3 properties a good measure M must satisfy:

- $M(A,B) = 0$ if A and B are statistically independent
- $M(A,B)$ increase monotonically with $P(A,B)$ when $P(A)$ and $P(B)$ remain unchanged
- $M(A,B)$ decreases monotonically with $P(A)$ [or $P(B)$] when $P(A,B)$ and $P(B)$ [or $P(A)$] remain unchanged

Comparing Different Measures

Property under Variable Permutation

	B	\bar{B}
A	p	q
\bar{A}	r	s

→

	A	\bar{A}
B	p	r
\bar{B}	q	s

Does $M(A,B) = M(B,A)$?

Symmetric measures:

❓ support, lift, collective strength, cosine, Jaccard, etc

Asymmetric measures:

❓ confidence, conviction, Laplace, J-measure, etc

Property under Row/Column Scaling

Grade-Gender Example (Mosteller, 1968):

	Male	Female	
High	2	3	5
Low	1	4	5
	3	7	10

	Male	Female	
High	4	30	34
Low	2	40	42
	6	70	76

2x

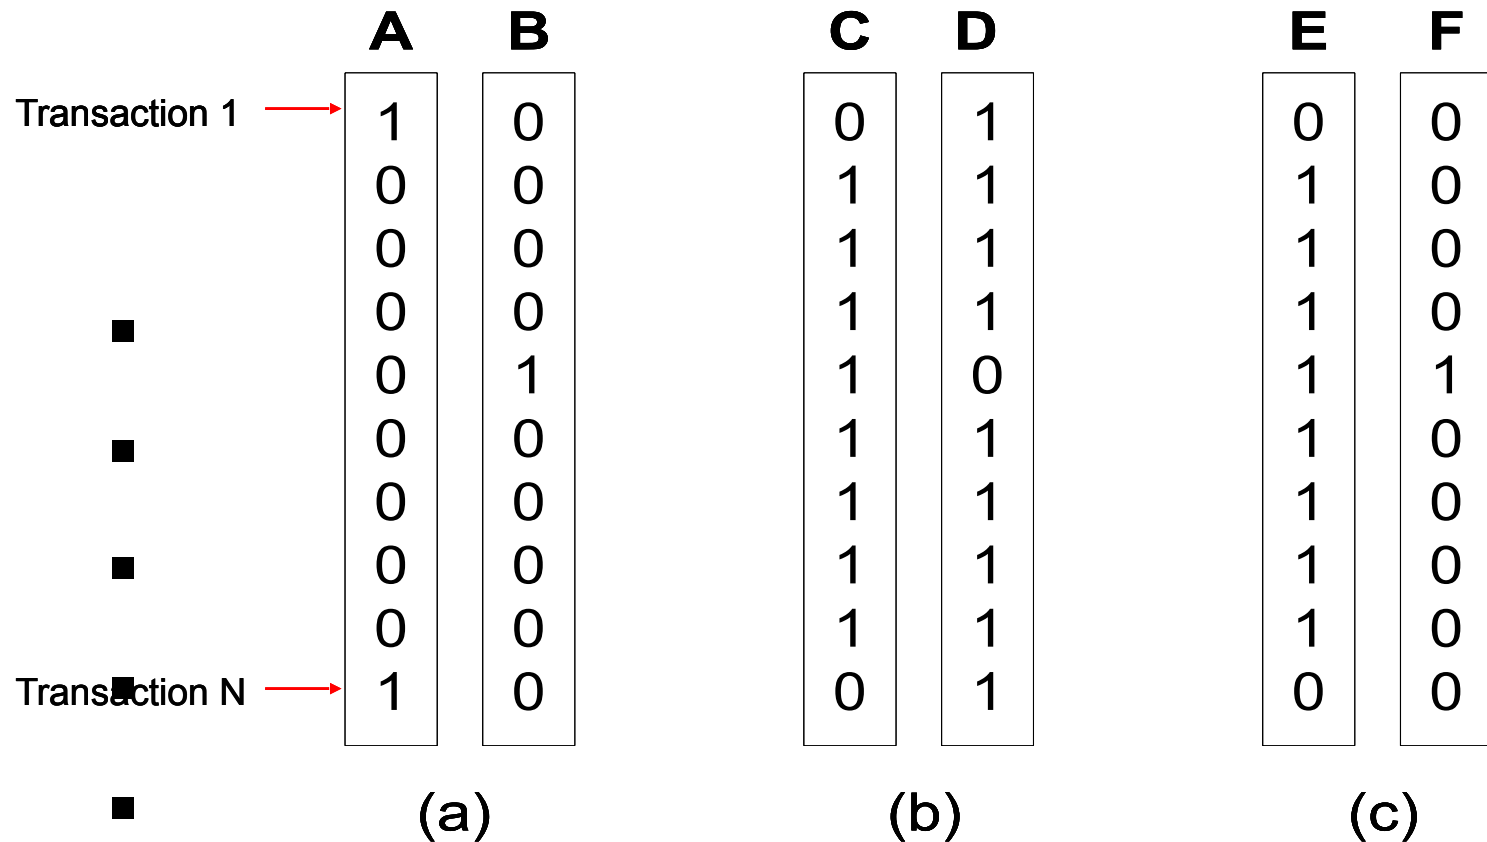

10x

Mosteller:

Underlying association should be independent of the relative number of male and female students in the samples

Property under Inversion Operation

Example: ϕ -Coefficient

ϕ -coefficient is analogous to correlation coefficient for continuous variables

	Y	\overline{Y}	
\overline{X}	60	10	70
X	10	20	30
	70	30	100

$$\phi = \frac{0.6 - 0.7 \times 0.7}{\sqrt{0.7 \times 0.3 \times 0.7 \times 0.3}} = 0.5238$$

$$\phi - coefficient = \frac{P(X,Y) - P(X)P(Y)}{\sqrt{P(X)[1 - P(X)]P(Y)[1 - P(Y)]}}$$

	Y	\overline{Y}	
X	20	10	30
\overline{X}	10	60	70
	30	70	100

$$\phi = \frac{0.2 - 0.3 \times 0.3}{\sqrt{0.7 \times 0.3 \times 0.7 \times 0.3}} = 0.5238$$

ϕ Coefficient is the same for both tables

Property under Null Addition

	B	\bar{B}
A	p	q
\bar{A}	r	s

	B	\bar{B}
A	p	q
\bar{A}	r	s + k

Invariant measures:

❓ support, cosine, Jaccard, etc

Non-invariant measures:

❓ correlation, Gini, mutual information, odds ratio, etc

Support-based Pruning

Most of the association rule mining algorithms use support measure to prune rules and itemsets

Study effect of support pruning on correlation of itemsets

- Generate 10000 random contingency tables
- Compute support and pairwise correlation for each table
- Apply support-based pruning and examine the tables that are removed

Effect of Support-based Pruning

Support < 0.01

Support < 0.03

Support < 0.05

Support-based pruning
eliminates mostly
negatively correlated
itemsets

Effect of Support-based Pruning

Investigate how support-based pruning affects other measures

Steps:

- Generate 10000 contingency tables
- Rank each table according to the different measures
- Compute the pair-wise correlation between the measures

? Without Support Pruning (All Pairs)

Scatter Plot between Correlation & Jaccard Measure

- ? Red cells indicate correlation between the pair of measures > 0.85
- ? 40.14% pairs have correlation > 0.85

? $0.5\% \leq \text{support} \leq 50\%$

Scatter Plot between Correlation & Jaccard Measure:

? 61.45% pairs have correlation > 0.85

? $0.5\% \leq \text{support} \leq 30\%$

? 76.42% pairs have correlation > 0.85

Scatter Plot between Correlation & Jaccard Measure

Subjective Interestingness Measure

Objective measure:

- Rank patterns based on statistics computed from data
- e.g., 21 measures of association (support, confidence, Laplace, Gini, mutual information, Jaccard, etc).

Subjective measure:

- Rank patterns according to user's interpretation
 - A pattern is subjectively interesting if it contradicts the expectation of a user (Silberschatz & Tuzhilin)
 - A pattern is subjectively interesting if it is actionable (Silberschatz & Tuzhilin)

Need to model expectation of users (domain knowledge)

+ Pattern expected to be frequent

- Pattern expected to be infrequent

□ Pattern found to be frequent

○ Pattern found to be infrequent

⊕ ⊖ Expected Patterns

⊖ ⊕ Unexpected Patterns

Need to combine expectation of users with evidence from data (i.e., extracted patterns)

Web Data (Cooley et al 2001)

- Domain knowledge in the form of site structure
- Given an itemset $F = \{X_1, X_2, \dots, X_k\}$ (X_i : Web pages)

L : number of links connecting the pages

$lfactor = L / (k \times k - 1)$

$cfactor = 1$ (if graph is connected), 0 (disconnected graph)

- Structure evidence = $cfactor \times lfactor$

- Usage evidence

- Use Dempster-Shafer theory to combine domain knowledge and evidence from data

$$\frac{P(X_1 \text{ ? } X_2 \text{ ? } X_k)}{P(X_1 \cup X_2 \cup \dots \cup X_k)}$$
